3 February, 2006

# Outline

## The Protocol

- Datagram Structure

- Downloading Files

- Uploading Files

## Flow Control

- Timeout

- Congestion Avoidance

# Outline

## The Protocol

Datagram Structure

Downloading Files

Uploading Files

## Flow Control

Timeout

Congestion Avoidance

## The Structure of the Datagram

**CRC** covers Type, Sequence ID, Payload

**Type** required operation and flags

**Sequence ID** identifies successive datagrams

**Payload** data required by operation

## Mechanism for Downloading a File

- ▶ The client pulls data from the server.
- ▶ The client asks for each segment using one datagram.
- ▶ The server responds each datagram with required segment.

## Mechanism for Downloading a File

- ▶ The client pulls data from the server.
- ▶ The client asks for each segment using one datagram.
- ▶ The server responds each datagram with required segment.

## Mechanism for Downloading a File

- ▶ The client pulls data from the server.
- ▶ The client asks for each segment using one datagram.
- ▶ The server responds each datagram with required segment.

## Datagrams Used for Downloading a File

Client request for downloading a file

	<b>Type</b>	<b>Payload</b>	<b>Flags</b>
(a)	4	offset, filename	none

Server reply for downloading a file

	<b>Type</b>	<b>Payload</b>	<b>Flags</b>
(a)	4	contents	EOF (optional)
(b)	4	empty	Error

## Mechanism for Uploading a File

- ▶ The client pushes data onto the server.
- ▶ The client places a segment into each datagram.
- ▶ The server acknowledges each datagram.

## Mechanism for Uploading a File

- ▶ The client pushes data onto the server.
- ▶ The client places a segment into each datagram.
- ▶ The server acknowledges each datagram.

## Mechanism for Uploading a File

- ▶ The client pushes data onto the server.
- ▶ The client places a segment into each datagram.
- ▶ The server acknowledges each datagram.

## Datagrams Used for Uploading a File

Client request for uploading a file

	Type	Payload	Flags
(a)	5	0 (32-bit), filename, contents	EOF (optional), Resume (optional)
(b)	5	upload id, offset, contents	EOF (optional)

Server reply for uploading a file

	Type	Payload	Flags
(a)	5	upload id, complete offset, capacity offset	none
(b)	5	empty	Error

# Outline

## The Protocol

Datagram Structure

Downloading Files

Uploading Files

## Flow Control

Timeout

Congestion Avoidance

## Timeout Calculation Using Round Trip Time Estimate

RTT and RTT deviation estimate:

$$RTT \text{ difference} = \text{actual RTT} - RTT \text{ estimate}$$

$$\text{new RTT estimate} = RTT \text{ estimate} + \frac{1}{8} RTT \text{ difference}$$

$$\text{new RTT deviation} = \frac{3}{4} RTT \text{ deviation} + \frac{1}{4} |RTT \text{ difference}|$$

The timeout is then calculated to be:

$$\text{Timeout} = RTT \text{ estimate} + 3RTT \text{ deviation}$$

## How the Client Avoids Network Congestion

- ▶ The client is solely responsible for congestion avoidance.
- ▶ The window size is initially set to one datagram.
- ▶ Window grows when no datagrams are lost.
- ▶ Window size halved for every lost datagram.

## How the Client Avoids Network Congestion

- ▶ The client is solely responsible for congestion avoidance.
- ▶ The window size is initially set to one datagram.
- ▶ Window grows when no datagrams are lost.
- ▶ Window size halved for every lost datagram.

## How the Client Avoids Network Congestion

- ▶ The client is solely responsible for congestion avoidance.
- ▶ The window size is initially set to one datagram.
- ▶ Window grows when no datagrams are lost.
- ▶ Window size halved for every lost datagram.

## How the Client Avoids Network Congestion

- ▶ The client is solely responsible for congestion avoidance.
- ▶ The window size is initially set to one datagram.
- ▶ Window grows when no datagrams are lost.
- ▶ Window size halved for every lost datagram.

# Summary

We have seen

- ▶ The datagram format.
- ▶ The protocol used for downloading and uploading files.
- ▶ The flow control mechanisms involved.
